The power source of our vehicles, that is, the battery not only performs the function of generating the engine ignition, but also supplies other components such as lights, dashboard, windscreen wiper, among others. Fuse Box 300 2005 Each of these elements is powered by the electric source of our car, however, electricity is not always reliable at all, it never happened to you that you have an electrical device and is burned by a sudden low and an increase in light, well in the car can happen the same thing. 300 with metal elements can control electricity and the circumstances of energy transmission transmission that overload on electrical elements. The overload can damage him and injure our pocket. The fuse box prevents such events, because it serves as a bridge between an electrical command and an electrically driven element, feels a high current that exceeds its tolerance, burns and becomes useless, disrupting the electric bridge and thus the passage. In the operating instructions you can see this information about how many and what types of fuses the Chrysler 300 2005 has, as well as the electrical system it protects. Where's the fuse box? Most cars have two fuse boxes: one located on the left under the steering wheel and the other in the engine compartment on the right. The internal fuse box is located at the height of the driver's knee, under the steering wheel on the left side. Where fuses from 300 2005 are access to the internal fuse box is somewhat complicated and even more so when it is necessary to replace the damaged fuse or look for an error in this box, because you need to get upside down or put your back on the floor next to the pedals and feet outside the car, put your head and be able to work. The inner cover of the fuse box requires pressure on the plastic housings in order to remove and open it. Operating manual 300 2005 To access this box, it is enough to open the hood and it is easily accessible, the fuse is pressed with one hand and the cover is removed to access the fuses and relays. Instead, the motor fuse is next to the battery, which is located to the right of the hood compartment. Each box has a corresponding lid in which the names of the electrical circuits that protect these fuses have been marked, as well as their current and location inside each box. Classification 300 2005 fuses In this user manual for ALTIMA 2005 you will find a classification of fuses that is quite friendly in identifying them because they have a color identification system, yes, how does it read by color, that is, if the fuse color is yellow or red will have different tolerances?, the answer is yes, depending on the color there will be different electrical tolerances, then we will name them. Fuse types 300 2005 Red: Tolerance 10 amps. Blue: Tolerance of 15 amps. Yellow: Tolerance of 20 amps. Green: Tolerance of 30 amps. Orange: Tolerance of 40 amps. Another note: The orange fuse 40A is a general fuse of the car's electrical circuits and the damage leaves the entire circuits of the car without power. For example, high-security fuses use pink and the fuse shape changes to a square part instead of flat and elongated, as in the case of the orange 40A fuse. The 40A fuse is not the only pink fuse because the same pink colour is used for currents 50A and 60A. Chrysler 300 2005 Maintenance If you are looking to have your Chrysler 300 in the best condition and for an extended period of time you must first know what automotive preventive maintenance is.
